

## COMMAND TUFF SUPPORT - GAS CHARGED LIFT SUPPORT

Gas springs are most commonly used in the family car to hold open the bonnet or boot and to provide control over the opening movement of these heavy and potentially dangerous apparatus.

### Advantages

- **Controlled Movement - the rate of motion of the spring is controlled by using special engineering techniques to slow or "damp" the shaft/rod movement, to a pre-determined rate.**
- **Measured force in Newtons to pre-determined tolerances**
- **Variable distances of movement of spring**
- **Long working life of gas springs**
- **Space efficient - gas springs require minimal space for housing within a mechanical environment**

Vehicles get old, and their lift supports lose the original charge, and therefore in many cases are NOT able to support the weight of the hoods, boot lids, back windows, back doors, hatches, tonneau covers, lids, tool box covers and beds that they are supposed to carry.

It is recommended that Lift Supports are replaced in pairs, since it is not possible to tell which Lift Support is damaged. If the wrong Lift Support is replaced, the new Lift Support will not work properly, and will deteriorate prematurely.

### TUFF SUPPORT "BB" Series...TOTAL BLACK

- \* BB series lift supports are manufactured with latest manufacturing methods.
- \* Heavy gauge body is painted with special epoxy paint, and heat baked for long life.
- \* Nitride rods are hardened, polished, and then painted for long life and applications.
